

Incident Response Policy

Purpose

This policy defines how Harbourline Freight Systems engineering classifies, acknowledges and resolves production incidents, and the internal targets each severity is held to.

Severity levels and targets

Incidents are classified P1, P2 or P3 on declaration. P1 incidents must be acknowledged internally within 15 minutes and are targeted for resolution within 4 hours. P2 incidents must be acknowledged within 1 hour and are targeted for resolution within 12 hours. P3 incidents must be acknowledged within 4 hours and are targeted for resolution within 5 business days.

These are internal engineering targets, distinct from any customer-facing commitment set out in a service agreement.

Severity	Acknowledgement	Resolution target
P1	15 minutes	4 hours
P2	1 hour	12 hours
P3	4 hours	5 business days

Incident commander

Every P1 incident requires a named incident commander, assigned as soon as the incident is declared, who coordinates the response and is the single point of contact for status updates until the incident is resolved. P2 and P3 incidents do not require a dedicated incident commander, though the on-call engineer remains responsible for driving them to resolution.

Status page

For P1 incidents, an update must be posted to the public status page within 30 minutes of declaration, and at regular intervals thereafter until resolution. Status page updates for P2 and P3 incidents are at the incident commander's or on-call engineer's discretion.

Post-incident review

Every P1 incident receives a written post-incident review covering root cause, impact and follow-up actions, coordinated by the incident commander. P2 incidents receive a review where the incident commander judges it valuable; P3 incidents typically do not.
