

On-Call Rotation Policy

Purpose

This policy describes how Harbourline Freight Systems engineering staffs its on-call rotation, the allowance paid for carrying the pager, and the limits placed on how often any one engineer is on call.

Rotation structure

On-call rotations run for 7 days, handing over each Wednesday at 10:00 AEST. Each rotation has a primary responder, who is paged first, and a secondary responder, who is paged if the primary does not acknowledge an incident within the response window set out in the Incident Response Policy. Handover happens at a fixed time regardless of public holidays, so that the schedule stays predictable across the team.

Role	Responsibility
Primary	First paged for any incident
Secondary	Paged if primary does not acknowledge

On-call allowance

Engineers rostered on call, whether as primary or secondary, receive a weekly allowance of \$900, paid in the ordinary pay run for the period in which the rotation falls. The allowance is paid in addition to any incident overtime that may apply separately under the employee's award or contract.

Frequency cap

To avoid burnout, no engineer may be rostered for more than 1 rotation in any rolling 4-week period, whether as primary or secondary. The rotation schedule is generated automatically from the on-call roster and is checked against this cap before publication.

Swaps

Engineers may swap an assigned rotation with a teammate of equivalent seniority, provided the swap is recorded in the on-call system before the rotation begins and does not put either engineer over the frequency cap above.
